Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil palm, groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and rice.

                                                                                                                                                                  glycanases, hormones, proteases, protease inhibitors, seed stora proteins, thrombin inhibitors, hirudin, interleukins, chymosin, xylanase, carp growth hormone, zein or a collagenase. The enzyme may be cleaved from the oil body protein or used in association with the oil body fraction.

Allows production of commercially important proteins on a superito protein on be easily separated from host cell components due to the use of the oil body as a carrier protein.
                                                                                                                                                                                                                                                                                                                       This is the amino acid sequence of a HindIII fragment containing the oleosin-spacer-Met-prochymosin sequence. This HindIII fragment was joined to a nopaline synthase terminator and cloned into binary vector pcGN1559. The resulting plasmid was called psBSOTPTNT and introduced into A.tumefaciens. The resulting bacterial strain was used to transformance.
                                                                                                                                                                                                                                                                          oil-body targeting sequence, a transcription regulation sequence and DNA of the protein of interest can be used to produce antibodies,
                                                                                                                                                                                                                                                                                               B.napus plants.
The DNA which encodes a chimeric fusion protein that consists of the

              Also claimed is E.coli JM83/pLC7 (ATCC 39325) which is transformed with pLC7 contg. the prorennin derived sequence fused in phase with B-galactosidase. The pLC7 prorennin expression plasmid includes sequences which code for both the pseudorennin and mature rennin cleavage sites between AAs 28-29 and AAs 42-43, respectively.

The inventors claim the prochymosin gene comprising a nucleotide sequence from (a) the 1st codon (GCT) to the 365th codon (ATC), or (b) the 5th codon (CGG) to the 365th codon (ATC); and recombinant plasmids harboured by Escherichia coli strains deposited as FERM BP-262, -263 and -264. Any portion of the nucleotide sequence as described in AAN40055 can be used. Also claimed is a vector derived from plasmid pBR322. Typically plasmid pCR501 is obtd. from pOCT 2.

GAL1 promoter linked to gene - useful for direction of expression of the gene in yeast of the recombinant material carrying a GAL1 promoter of the yeast galactokinase gene may be used in expressing a desired protein, bovine growth hormone, interferon, prorennin or preprorennin, it yeast cell. Strains of Saccharomyces cerevisiae producing the polypeptides are produced. Yeast strains deposited as ATCC 2064: 20661, 20662 and 20663, strain designations CGY 196, 457, 461 are serviced.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The DNA encoding prochymosin can be cloned into a plasmid (esp. from S. cremoris SK112) and used to produce large amts of the protein by recombinant DNA techniques. This could overcome shortages of prochymosin due to a shortage of calf stomachs and increasing cheese prodn. Prochymosin is also used in prodn. of yoghurt, butter and buttermilk.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA sequences either side of the protein sequence can be removed and are not essential to use of the gene in expression. The protein may be expressed in E. coli using plasmid pcGE21. The resulting expressed enzyume is a well known milk-clotting enzyme used in cheese-making.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       appropriate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transformed cells producing rennin and appropriate recombinant DNA material
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-DEC-1981;

The prorennin (prochymosin) sequence was deduced from the DNA sequence obtd. by screening a cDNA library with rennin specific probes derived from the published amino acid sequence of rennin (Foltmann et al., J. Biol. Chem. 254, 8447-8456 (1979)) (see 233291,2). The deduced protein sequence was the same as the published sequence after cleavage of the signal peptide, except for an amino acid change at residue 218, which may be an artefact of protein sequencing in the original sequence. The cleavage product of prorennin, rennin is synthesised in two active forms rennin A, and rennin B. The cleaved

The Kluyveromyces expression systems provide highly efficient secretion and processing of a wide variety of proteins. Sequences identical to those published in EP301669.

A; Title: New world monkey pepsinogens A and C
A; Reference number: JC7245
A; Accession: JC7245
A; Molecule type: mRNA
A; Residues: 1-387 < KAG>
A; Cross-references: DDBJ: AB038384
A; Cross-references: DDBJ: AB038384
A; Experimental source: strain NW794
C; Comment: This protein, a zymogen of pepsins volution of mammalian orders and families.
C; Superfamily: pepsin
C; Keywords: gastric juice; zymogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               pepsinogen A - common marmoset
